Pruning must be made before breaking the sprout by removing dead, damaged and overlooked branches (4). Live branches removed due to overgrowth can be used as cuts also for propagation purposes. Though Successful cuttings, the sowing material must be obtained from the stem above the first set of leaves of the plant. In areas with an extremely cold climate, it is important to select rose plants that are hard cold and suitable for the location. During the winter, a tumulus tumulus technique the inches of soil on the basis of the rose plant after the soil has frozen protects the plant from winter damage (4).
