Watch video while on call android. Watch video on android auto without root. Watch video on android auto. How to watch prime video on android tv. Watch video on android phone. How to watch same video on two android. How to delete facebook video watch history on android. How to watch video on android tablet.

Streaming video plays a big role. Lots of people subscribe to Netflix, Hulu, VRV, and even YouTube as their main streaming video services. However, there are still many people who have video files on their phones. Watching movies isn't as complicated as it used to be. Most of the video playback applications can play the most popular video codecs without any problem. That is, unless you are using some weird codec. Even if you use it, you still have plenty of chances to see it. Let's take a look at the best Android video playback apps. Kodi is a good option that we don't include in this list as it works more like a media player. A link to this list is provided at the bottom of this article. Best Android Video Player App AllCast is a video player that specializes in sending locally stored content to Chromecast, Roku, Apple TV, Xbox 360 / One and other DLNA compatible devices. Besides movies, it also supports other types of media. It has a bit of a tough start, but has quickly grown to become one of the most reliable streaming apps out there. The free version has a content limit of five minutes while the pro version has no limit. You can also turn your Android device into an AllCast receiver (which it can transmit) using the AllCast Receiver app. Archos is one of the most popular video playback apps for Android. It supports most types of video files, including MKV, MP4, AVI, WMV, FLV, etc., as well as various types of subtitle files, such as SRT, SUB, ASS (yes, really), SMI, and more. Other features like server and NAS support, external USB storage support and more are of course available. The app also has a relatively modern interface, simple controls, and information from sites like IMDb, themovieedb.org, and more. In practice, we didn't find any real problems with this, although some reviewers on Google Play did notice. In any case, it's a good choice with the cheap pro version. Joe Hindy / Android AuthorityBSPlayer has been around for over a yearvideo player app and is still one of the best out there. It offers multi-core hardware decoding, hardware-accelerated playback and support for streaming from network devices (DLNA). It comes with subtitle support, the ability to play files from compressed formats, and you can even create a pop-up window if you want. The free version is ad-supported but has all the features. Additional plugins are also available for even better support. The full version costs \$5.99. Price: Free with in-app purchases LocalCast is an AllCast competitor and performs many of the same functions. This includes streaming media from your device to a Chromecast, Xbox 360/One, Roku, Fire Stick or Apple TV. Along with AllCast, it allows you to stream from cloud storage (Google Drive, Dropbox) and should work on most DLNA compatible devices. It only has codecs supported by Chromecast. This should be true for most major codecs today. However, it is one of the few respected video player apps that performs this function. MX Player has long been one of the most popular video playback applications. It supported multiple formats long before other video playback apps and was one of the first to include things like hardware decoding, hardware accelerated playback, and other such features. It still has all of those things, plus gesture controls (including pinch to zoom), subtitle support, parental controls so your kids can watch Disney movies, and it supports almost every codec out there. Like MoboPlayer, it comes with additional plugins that add additional features when needed. Price: Free / \$4.99 / \$4.99/month Plex is currently the best answer to what to do with tons of movies on your phone and only 32GB of space. Plex allows you to set up a server on your computer and then stream content from your computer to your smartphone. It is a bit unique from othersplayers, but also does not require your files to be stored on the device. This frees up valuable storage space for other things. The service is free, the mobile app costs \$4.99, and you can get an additional subscription for \$4.99 a month to unlock all Plex Pass features. VLC has quickly become one of the must-have video playback apps. It has some unique features including the ability to stream videos if you have the URL. It can also play some obscure video formats like DVD ISO. Unlike most, it also has all the built-in codecs without downloading additional plugins. Other features include subtitle support, full media support (including audio), multi-track audio, and more. There is also a beta version if you want to try out the latest features. Video Player All Formats is a basic video player app. It is also something like a rough diamond. Supports most video codecs. Some other features include Chromecast support, night mode, privacy folder, and variable speed playback controls. It seems to have ticked all the boxes during our testing. In addition, there are no banner ads, although they are available elsewhere. You can unlock the ad-free version for \$3.99. He's definitely one of the weakest in our top 10, but still good enough to be here. Xender is a combination file transfer app and video player. You can share music and videos with people in your area without using mobile data. Moreover, the app can play most movies and music files without much effort. This makes it a decent option for this sort of thing, although it doesn't have any of the advanced display or playback controls that many dedicated video playback apps have. This is a good solution for those who need to share media with friends and then watch or listen to that media. It's free and surprisingly popular. The default video player on your device works greatsince ancient times. Today they play almost everything. You already have it in the app drawer. It already takes up disk space and is usually impossible to get rid of. You might as well at least give it the old college try. Overall, Android gets better support for video codecs every year, including HDR VP9, starting with Android Pie. OEMs usually provide support for all of these things in a standard video player. Some of them can even play streams like VLC. Definitely give it a try before you move on to something else. This is usually the path of least resistance. 1 Open the Spotify app. The Spotify app icon is green with three curved black lines. 2 In the bottom navigation menu, click Search. At the bottom of the app, you'll see a menu with three icons. Tap the search icon, which is a magnifying glass. 3 Under Browse All, scroll down to Videos. Below the search bar you will see a series of colored boxes with labels. Scroll down to the Browse All section and tap on the Videos section, which is blue. 4 Browse through the recommended programs to find the one that interests you. Spotify Studios has produced plenty of shows for you to watch. Go to the program selection page and select the one you want to watch. Click on a show to play it. 5 In the All Videos list, tap the episode you want to watch. You will be redirected to the main page of the program. All episodes are organized into a kind of playlist. Start with the first episode or scroll down to find the episode you want to watch. 6 Search for a specific video by entering a search term in the search box. Go to the top of the screen and tap the search bar to find a video. Tap on the search result that says Video Episode below it. 7 Click the up arrow to expand the video. Tap the up arrow on the left side of the app, just above the bottom menu. Ask a Question This article was co-authored by wikiHow staff. Even if your phone has a built-in media player, VLC doesn't have anything on it. The popular third-party video player supports virtually all codecs and file formats, and better yet, you can use it to stream movies, shows, and other video files from your computer to your phone. With media loaded onto your Windows PC, you can easily play music or videos on your phone or tablet. Next, let's look at how to set up sharing on a Windows PC to stream with VLC for Android. Both devices must be on the same local network to use this feature, but it's a great way to access your personal movie library from anywhere in your home. Don't Miss: The 4 Best Phones to Watch Netflix and Stream Videos Quickly First, install the VLC app on your Android device, which you can download from the link below. Install VLC for Android for free from Google Play Store. Before we get too far, it's a good idea to enable VLC's background playback option so you can listen to the audio after exiting the app. Whether you're streaming media over a network or playing a local file, it's easy to achieve by turning on a small setting. To do this, go to "Settings" in VLC's side navigation menu, check the box next to "Play videos in background" and you're done. Although VLC can use different protocols for streaming, the easiest way to achieve this feat is by sharing a homegroup. To do this you may need to change some settings on your Windows computer if you are not already using this feature.Windows Control Panel and select "Network and Sharing" (or "Network and Internet"). Click on the "Homegroup" link here. If you haven't set up a homegroup, you'll need to click the "Create Homegroup" button to get started. After the initial request with an explanation of HomeGroup, you will have the option to choose what you want to share. I recommend sharing music and videos because VLC is used. After clicking "Next" you will receive a password that will allow other Windows computers to access these files, but this is not required for the VLC application, so click the "Finish" button. Once the setup process is complete, you'll be returned to the main homegroup settings screen, so click on the "Allow all devices on this network, such as TVs and game consoles, to play my shared content" link. Here, uncheck "Allowed" in the "Media programs on this computer and remote connections..." box, because this is not required for this service. When you're done, click "Next" to finish. From now on, whenever you want to transfer a media file from your computer to your Android device, start by opening the VLC app on your Android device. From there, navigate to the side navigation menu and select the "Local Area Network" link. As long as both devices are connected to the same network, you should see your computer name next to the folder icon. Open it, navigate to where your media is stored and tap on the file to listen or watch it with VLC. It really is that easy! Don't Miss: All of our VLC 101 guides will keep your connection secure without a monthly bill. Get a lifetime VPN Unlimited subscription for all your devices with a one-time purchase from the new Gadget Hacks Shop and watch Hulu or Netflix without regional restrictions, improve your public network security, and more.
