Arcsight smart connector user guide user

Correlation Diagram

Arcsight smart connector user guide. Arcsight smart connector guide. Arcsight smart connector installation guide.

8.0.0 The doc is outdated. You will also be able to switch between a standalone application installation or as a service installation. With time auto-correction you will be able to specify forward and backwards time limits for your events. Modifying Cache settings If the configured events destinations are down, or if the number of EPS are too high to be forwarded by batching, the SmartConnector will begin to cache the events. If the values are exceeded the SmartConnector will automatically correct the time with the SmartConnector time. 9000 for software Logger, 443 for appliance Logger and 8443 for ESM. In case of forensics purpose to loose the "real" timestamp could be dramatically. Loose the "real" timestamp of the events, if you don't preserve raw events. You're Reading a Free Preview Pages 92 to 98 are not shown in this preview. Adding/Removing/Modifying SmartConnector Destinations By selecting "2 - I want to add/remove/modify ArcSight Manager destinations", you will be able to modify your initial destination configuration, in our case a L750MB Logger, or to add a new destination, for example another Logger or ESM (Enterprise Security Manager) This configuration option will allow you to add a fail over destination or also to re-register a SmartConnector. The setup of the fail over destination is the same as creating a first destination, you will have to provide the following information's : Host name or IP address of the fail over destination (Manager or Logger) Port of the actual destination (Manager or Logger). Changing SmartConnector parameters By selecting "0 - I want to change SmartConnector parameters", you will be able to change, for example on a Syslog Daemon SmartConnector, the network port, listener IP address and associated protocol. The translated version of this page is coming soon. Also you will be able to provide a "Device Time Correction" in seconds for all devices how are sending their events to this SmartConnector. By default the "-1" values are disabling the auto-correction, you can specify values in seconds for the forward and backwards time limits, and also filter by devices separated by commas. The configuration of each SmartConnector is customizable in order to activate batching, time correction, caching, QoS (Quality of Service), aggregation or filtering. Modifying actual SmartConnector destination parameters If you select your actual destination you will be able to modify your actual destination parameters "0 - Modify destination parameters" : Host name or IP address of the actual destination Port of the actual destination Receiver Name of the actual destination Enable or not compression mode Compression mode will allow the SmartConnector to send events to the destination in a compressed format and lowers the network bandwidth usage. You will also be able to provide a "SmartConnector Time Correction" in seconds, if the server where the SmartConnector is installed don't has a synchronized NTP. If the SmartConnector is caching you will have this kind of event : deviceEventClassID : agent-019 name : Agent is currently caching events message : Agent cache contains [100] events deviceEventCategory : /Agent/Cache/Caching If the SmartConnector is emptying his cache : deviceEventClassID : agent-020 name : Agent cache empty deviceEventCategory : /Agent/Cache/Empty In the next blog post we will continue to describe SmartConnector network, field based aggregation, filter aggregation, processing and filters settings. You're Reading a Free Preview Pages 31 to 32 are not shown in this preview. This could be useful to have a copy of the events or to setup a lab environment in parallel of your production environment. You can configure additional destinations by selecting "1 - Add new destination". Cache files are stored in "\$ARCSIGHT_HOME/current/user/agent/agentdata" folder. The default configured value is 5 seconds. By the SmartConnector will forward events how are 300 seconds in the future and forward events how are 3600 seconds in the past, compared to the SmartConnector time. In this blog post we will show some examples on how to configure your SmartConnector. In "\$ARCSIGHT_HOME/logs/agent.log" file, you can see that these settings are activated by : But take care, time correction is not a setting to configure without knowing what you are doing. You're Reading a Free Preview Pages 116 to 124 are not shown in this preview. You're Reading a Free Preview Pages 8 to 17 are not shown in this preview. In "\$ARCSIGHT_HOME/logs/ags.log" file, you can see that these settings are activated by : Modifying time checking settings These settings will allow you to specify the time threshold and frequency for device time checking. If you modify the timestamp of the events, you will : Gain the ability to do events searches, generate reports or valid correlation rules on the ESM or Logger based on the same timestamp. Modifying time correction settings ArcSight SmartConnector will allow you to do time corrections. For example, if you have a remote SmartConnector how has a valid NTP synchronization : The end device could have time troubles, cause no NTP configured or bad NTP configuration. Modifying batching destination settings SmartConnectors allow you to batch all processed events, in order to increase performance and bandwidth usage, by three options : Batching per events : The connector will wait that the provided value of events is reached and then send the block of events to your destination. If the device is in the past, you should normally receive this kind of event: deviceEventClassID : agent-012 name : Device Receipt Time from [centos5-6-1.zataz.loc]192.168.178.76[Unix[auditd]] may be incorrect - Device Receipt Time is smaller than Agent Receipt Time (Events are in the past) deviceEventCategory : /Agent/Time/Device/Failure deviceReceiptTime : The device time how is in the past. You're Reading a Free Preview Pages 82 to 84 are not shown in this preview. Configure multiple parallel destinations ArcSight SmartConnector is also able to send a copy of events to each additional configured destinations. But you have also to take into account the aggregation settings how will reduce drastically the size of events in your cache. Caroline Oest Micro Focus Customer Experience Marketing If you find this post useful, give it a 'Like' or use 'Verify Answer' can we have the latest one? Do not click links or open attachments unless you have verified this email is legitimate.Greetings!The SmartConnectors are available (framework engines and parsers) from the main Software Portal. For example, you can find them under the ADP Logger download area as one location.-MacGyver With the free ArcSight Logger L750MB, you have download some associated SmartConnectors, Snae SmartConnector, Cisco IOS SmartConnector, Unix Auditd SmartConnector, etc. The "Severity Based" selection will allow the SmartConnector to send batches based upon the events severity (highest first then lowest). This is tagged as 7.13 but it's 7.14. For example a device with 25 EPS, and with an average size of 300 bytes per event, you will have the default 10 000 events threshold limit reached in 400 seconds, and the default 1 GB cache size reached in 143 165 seconds (39 hours). agentReceiptTime : The time of the SmartConnector. agentReceiptTime : The time of the SmartConnector. SmartConnector Configuration setup Under Windows, you will need to run the "runagentsetup.bat" script and under Linux the "runagentsetup.sh" script. The default configured value is 100 events. You could for example send your events in parallel to two Logger's, or to one Logger and one ESM, or to two ESM. The tag is incorrect. Receiver Name of the actual destination (Logger) Enable or not compression mode (Logger) Some specific configurations are necessary for an ESM destination like "ADP Master Destination", "Filter Out All Events", ESM user name and password, but we will not describe these configurations settings. You're Reading a Free Preview Pages 103 to 108 are not shown in this preview. Batching per seconds : The connector will wait that the provided value in seconds is reached and then send the block of events to your destination. The end device could be in a different timezone than the remote SmartConnector. Don't show this message again The SmartConnector Installation and User guide can be found here. Comment List Hi,New to Arcsight, can you get a free trial copy of Arcsight smart connectors - cant get any response from Arcsight Sales team Hello Velatte, I don't see Connectors offered on But I will double check with the product manager! Caroline Oest Micro Focus Customer Experience Marketing If you find this post useful, give it a 'Like' or use 'Verify Answer' Hi, The index has been updated with the latest version of the guide, click here. In the meantime, content will appear in standard North American English. You're Reading a Free Preview Pages 68 to 78 are not shown in this preview. You're Reading a Free Preview Pages 22 to 25 are not shown in this preview. Sent a message to the documentation team, stay tuned..... Hello bpramodh, first of all, you need to have a valid contract with MF for ArcSight products acquired. Second, the portal where you can download the ArcSight products acquired is: authenticated you need to introduce the SAID or Order Number to be recognized by MF portal and to be able to download the software products. Best Regards, Daniel Caution: This email originated from outside the organization. By setting "Use Connector Time as Device Time" to yes, the SmartConnector will override the reported device time by using the SmartConnector time. Please update. Batch by time based or severity based : The "Time Based" selection will allow the SmartConnector to send batches as they arrive, how is the default configuration. The scripts are located into your "\$ARCSIGHT_HOME/current/bin" directory. With the cache settings you will be able to adjust your cache size from 5MB to 50GB (by default 1GB), after how many events the SmartConnector will trigger a notification, by default 10 000 events, and the frequency of these notifications from 1 minute to 60 minutes, by default every 10 minutes. If the device is in the future, you should normally receive this kind of event: deviceEventClassID : agent-012 name : Device Receipt Time from [centos5-6-1.zataz.loc]192.168.178.76[Unix[auditd]] may be incorrect - Device Receipt Time is greater than Agent Receipt Time (Events are in the future) deviceEventCategory : /Agent/Time/Device/Failure deviceReceiptTime : The device time how is in the future. The cache will work in a FIFO mode (First in, First out) if the cache is full, so you have to adjust your cache depending on the number of EPS of the device. Another example of time correction is if the device doesn't have a valid configured timezone or if the device events don't report the timezone, you can through this option specify the desired timezone on the SmartConnector. If you have high volume of events, you should prefer the "Severity Based" selection in order to have a focus on high severity events first. Changing SmartConnector service settings By selecting "1 - I want to change SmartConnector service settings", you will be able, same as for the first option, to switch between a standalone application installation or as a service installation. You're Reading a Free Preview Pages 37 to 61 are not shown in this preview. Adding a fail over destination to your actual SmartConnector If you need to have a fail over destination for your actual SmartConnector configuration you will have the choice between an ESM or Logger destination. You're Reading a Free Preview Pages 129 to 137 are not shown in this preview.

However user can create his own set of functions in a transfer function and can include this in other transfer functions. Q: Have you used rollup component? Describe how. Answer: If the user wants to group the records on particular field values then rollup is best way to do that. Rollup is a multi-stage transform function and it contains the ...
