If you are vigilant, you will find QR codes everywhere. These black and white squares connect the real world to the Internet, and when scanned, they provide quick access to ID cards, restaurant menus, social networking sites and more. QR codes are so popular that almost any device with a camera can be used to scan them. Here's how to do it using your phone, tablet, or computer. How to Scan a QR Code with an iPhone or iPad Both iPhone and iPad have a QR scanner built into the camera. 1. With the QR code nearby, open the camera on your iPhone or iPad. 2. Position the camera so that the QR code is in the frame. Your iPhone or iPad should automatically scan it without requiring you to do so. After scanning the code, a notification will appear at the top of the screen with a link to the contents of the QR code. Click on it and it will take you there. Make sure all four corners of the QR code are inside the frame. Ron Lyons Jr./William Antonelli Quick Tip. If you don't see the notification, make sure QR code scanning is enabled. Open the Settings app, tap Camera, and make sure Scan QR Codes is turned on. How to scan a QR code with an Android phone or tablet Like Apple users, Android devices have a QR code scanner built into the camera. However, you may need to open a dedicated application to use it. With the QR code nearby, open the camera on your Android device. 2. Position the camera so that the QR code is inside the frame. Your Android should automatically scan it, but if it doesn't, press and hold it with your finger. You will receive a link to a QR code and the option to open it, copy the URL, or share it. You have several options for what you can do with the QR code. William Antonelli/Insider If that doesn't work, download the Google Lens app from the Play Store. The QR scanner of this app is one of the main features. How to Scan a QR Code on a Mac People don't often scan QR codes with a computer, but if your Mac has a camera, it's easy. This and the free app we found is QR Journal, which you can download from the App Store. 1. Download QR Magazine and open the app. 2. Click Scan in the upper left corner and let the program use your Mac's camera. You may need to restart the application after this step. Select "Scan". William Antonelli/Insider 3. With the camera on, place the QR code in front of the computer's camera. Once it is identified, you will be able to open or save it. You can open or save the link. William Antonelli/Insider How to Scan a QR Code in Windows On PCs, the process is similar. We recommend downloading the Windows 10 QR code from the Microsoft Store. 1. Download the QR code for Windows 10 and open the app. 2. Allow the app to access your camera, then place the QR code in front of your computer's camera. Make sure the QR code fits in the camera frame. William Antonelli/Insider 3. The app reads the QR code and then opens it in the app's browser. Your smartphone is full of surprises. If you want to use your phone as a magnifier or scanner, there's an app. Tap or click here to view hidden apps on your smartphone and learn how to find them. Third-party apps take up space on your phone, and many of them are redundant to the phone's built-in features. Tap or click here to see the popular apps you can remove now. Quick response codes, better known as QR codes, are the squares of pixels you see in restaurants, advertisements, stores, food packaging, business cards, airline tickets, and everywhere else. Some developers may trick you into thinking you need to download their app to scan them. Spoiler: Your phone can do this with built-in features. Follow the Maze QR codes were originally created for tracking car parts, but are now used for much more. Readers can scan this QR code to donate to the American Red Cross and join FOX Corporation's Hurricane Ian relief efforts. (FOX Corporation) Howcalories in this potato? Where can I buy the clothes you see in the ad? How many miles can this car go on a gallon of gasoline? A quick scan of a QR code can solve all these questions and more. Think of this technology like a smart barcode. QR codes have existed long before smartphones, and your device can scan them right out of the box. Here's how to use this handy feature without third-party software. Use your phone's built-in features to avoid malware. Third-party scanning applications are popular, making them the main malware delivery systems. Hackers hide dangerous code in these useful apps that can steal your money, your personal information, and even take control of your device. RELATED: QR Code App Caught Hiding Malware Check Your Phone! How to Scan a QR Code with the Camera App on iPhone The iPhone's built-in camera app can scan QR codes and it's as easy as taking a picture. Here's how: Open the Camera app and raise your iPhone so the QR code appears in the viewfinder. The phone should recognize the QR code and display a notification. Tap the notification to open the link associated with the QR code. How to Scan a QR Code with an Android Phone Your Android phone's camera can scan QR codes without using a third party app. Here's how to do it. Open the Camera app and hold your Android phone so that a QR code appears in the viewfinder. The phone should recognize the QR code and display a notification. Tap the notification to open the link associated with the QR code. If they are not notified, go to Settings and enable QR code scanning. This photo shows the Android logo on a smartphone. Here's how to do it. Open the Camera app and lift your Samsung phone so that a QR code appears in the viewfinder. The phone should recognize the QR code and display a notification. Click alert for opening a link associated with a QR code. If you haven't received the notification, go to Settings and enable QR code scanning. Using Google Lens Google Lens started as a feature on Pixel phones, but soon became standard on many Android phones. This tool is part of your camera app and can do a lot of things, from detecting a dog's breed to translating text. Here's how to use it. Open the Camera app and tap More > Google Lens. You will now have a lens icon that you can use whenever you open the camera and it can scan QR codes. You can also use Google. Google Lens activation assistant. Say "Ok Google" and then tap Google Lens in the bottom right corner. Tap or click here to see more options with Google Lens. Learn more about anything with Bixby/Samsung's QR code virtual assistant. Here's how: Launch the camera app and tap Bixby Vision. Then click Allow to enable the permission. Turn on all popup permissions. Scan and click "Go" to view the contents of the QR code. During this unfavorable time of the coronavirus pandemic, QR codes are one of the best ways for businesses to receive cashless payments and share information with customers without physical contact. But do you know how big your QR codes need to be for better scanning even from a distance? Read on to find out. What is QR code removal? QR code distance refers to the size of the QR code relative to the distance from which it will be scanned. When designing QR codes for printed materials, it is important to keep this aspect in mind so that users have no problem scanning your QR codes. By designing an appropriately sized QR code, users can scan it remotely. The farther they can be scanned, the more likely you are to get more full scans. During a pandemic such as the coronavirus, it is important to avoid cash payments and avoid touching potentially contaminated surfaces to reduce the chance of spreading the disease. QR codes are one of the best ways to do this, as users can make payments and exchange information without physically touching anything other than their smartphone. Unfortunately, Italy is one of the most affected countries and has already implemented QR codes for cashless and contactless payments to support small businesses. Other companies can then harness the contactless power of QR codes and place them on printed materials to allow users to make payments or share relevant information. Overall, QR codes are the perfect tool for things like: QR codes enable convenient and contactless mobile payments. Source: mobiletransaction.org Scanning QR codes from a short distance QR codes can be easily scanned from a short distance. Unlike NFC, which has a radius of 4 cm (1.5 inches), QR codes have a minimum radius of 25 cm (10 inches), which then increases depending on the size of the QR code. The only requirement is that the QR code must be at least 2 x 2 cm (0.8 x 0.8 inches), otherwise the QR code scanner may have trouble scanning and viewers may have trouble reading it. NFC scan radius vs. QR code QR codes that are typically scanned from a short distance include: A QR code in a directory requires a short scanning distance. The key is that all of the items on the list above can be used for touchless and mobile marketing. Payments based on QR codes. In addition, they are also convenient for users as users do not need to search for links or a separate payment system. Just scan the QR code and they will be automatically linked to the appropriate digital content or payment platform. Required size to scan a QR code at short distances Although the minimum QR code size is 2 x 2 cm (0.8 x 0.8 inch), QR codes should be as large as you need. They use high quality images, pixels are not too blurry. Location must also be considered when designing a QR code to be scanned from a minimum distance. For example, if you use a QR code in an advertisement printed on a train, you need to consider where it will be scanned from. It may happen that not only people sitting next to you, but also people from other places will want to scan the QR code. As a result, a QR code should be created enough to accommodate these variables. In general, use larger sizes to avoid losing scanned QR codes. Make sure your QR code is large enough for any potential user to scan. Scanning QR codes from a distance The farther the QR code is to be scanned, the larger the QR code must be. When you put a QR code on something like a billboard ad, the QR code needs to be scannable from a distance for it to still work. Other types of QR codes that are scanned remotely include: Display posters Retail vehicles The QR code on a storefront can be scanned remotely at the correct size. Some of these methods can still scan QR codes from a short distance. However, you should always make sure that the maximum scanning distance is possible so that you don't lose any wires. The size required to remotely scan a QR code The size you need depends on many factors, including the height at which you place the QR code display (i.e. the higher the QR code is from eye level, the larger it needs to be), various angles, from which it can be scanned, and if you can create an image high enough that the QR code pixels are still clear. The higher the QR code is placed, the larger it should be. Overview of QR code sizes by reading distance To help you determine the size of a QR code, here is a table with an overview of the reading distance and the approximate size that QR codes should be in relation to this distance. As mentioned above, always choose larger over smaller to ensure that the QR code is readable and scannable from the maximum distance. The size information always refers to the exact square shape, otherwise the QR code will not work properly. Scan distance QR code Size range 1.5-2.5 ft (45-75 cm) 2.4-6.3 in (6-15.8 cm) - magazines, catalogs 4-12 ft (1.2-3.6 meters) 6.3-30 inches (16-75 cm) - posters, window 12-25 feet (3.6-7.6) Billboards 19" - 61.3" (48cm - 157cm) We have listed the areas here because you need to adjust the scan size and spacing according to the QR code placement conditions. We recommend that you print at least three different sizes and then compare to see which matches the scan radius you want. The image below shows a typical directional scan radius to consider in QR codes. If you need a larger scan radius, you need a larger QR code. Directional radius for QR code scanning More tips to enable QR code scanning. To ensure that a QR code is accurate, clear, and legible, there are three other important things to note that are not appropriate for scanning a QR code: quiet zone, image quality, and color contrast. Save Quiet Zone The left image has the quiet zone removed while the right image shows a correctly generated QR code. The quiet zone is the area around the QR code that separates the QR code's pixels from other patterns. QR codes require a quiet zone so that scanners can recognize which images are QR code pixels and which are not. Without a quiet zone, the QR code will most likely not work. Use high-quality images Always print large, high-quality images of the QR code so they can be read and scanned remotely. We've mentioned image quality before, but we're going to emphasize it again here because it will all take over your design efforts. That's a lot if the image quality of the QR code is too low to read. Our QR codes can be downloaded as image files in JPG, PNG, EPS and SVG formats and then inserted into any graphic design using a photo editing tool. Again, it's a good idea to compare several different images and sizes of the QR code to ensure the resolution is high enough to be scanned remotely. Choose an appropriate color contrast The left image shows the wrong color contrast, the right image shows the right color contrast Another important element of a good QR code design is contrasting colors. This rule applies both to the reference material behind the QR code design and to the design itself. In the image below on the left, there is no color contrast between the QR code and the surrounding design. Quiet zone is also removed so the QR code scanner cannot detect this QR code. The image on the right shows how to properly create a color contrast. Correctly.
