How do i enable wireless display on my phone. How to enable wireless display on samsung. How to enable wireless display on android 10. What does enable wireless display mean.

Two-factor authentication is an extra layer of security for your Google Account. It means unauthorised people won't be able access your e-mails in Gmail, your saved bookmarks or internet history, even if they know your password. This is done by sending a special six digit code to your phone, the first time you sign in from a new location. Both the code and your password are required to sign in. This hugely increases the security of your account. In this guide, we'll explore how to secure your Google account, firstly through providing recovery information, then setting up Two Step Verification itself. How to boost your Google account's security Prev Page 1 of 9 Next Prev Page 1 of 9 Next On your Android device go to Settings > Google > Sign in and Security. Alternatively use your web browser to navigate to the Google Account security website (opens in new tab). Click 'Get Started' to begin the process of reviewing the security settings for your account. You will be asked to sign in with your Google Account password.In the 'Add Recovery Information' click 'Add Phone' if your current mobile number is not listed. Google will send you an SMS with a verification code. In future Google can use this number to alert you of suspicious account activity. Feel free to add an alternative recovery e-mail address while you're here then click 'Done'. Prev Page 2 of 9 Next Prev Page 2 of 9 Next On the Sign in and Security (opens in new tab) page of your Android Device, click 'Recently Used Devices'. Alternatively scroll down to this section in your web browser.If you notice anything suspicious click 'Secure your Account', then on 'Change Password'. Even if you recognise a device is listed, if you no longer use it, change your password now.If you click the 'Change Password' button, you'll be asked to sign in with your current password, then set a new one. Google passwords must be at least 8 characters in length. Try to use a mixture of upper and lower case as well as numbers. Prev Page 3 of 9 Next Prev Page 3 of 9 Next The final step before setting up what Google refers to as '2-Step Verification' is to check which apps are connected to your Google account and their level of access. The reason for this is that they may be able to keep on accessing your account even after you set up 2-Step Verification, so it's important to know exactly what is going on. In the 'Sign in and Security' section of your Android device or web browser, scroll down to the section 'Apps Connected to your Account'. If you see any apps you don't recognise click on either the name of the app or 'Manage Apps' to display the 'Remove' button. Prev Page 4 of 9 Next Prev Page 4 of 9 Next Again in the 'Sign in and Security' section of your Android device or web browser scroll down to '2-Step Verification'. Click the word 'Of', then 'Get Started'. You'll be asked to sign in again.You'll first be asked to set up your phone and which number you want to use. By default this is the recovery number we set up earlier but enter another here in you prefer.Choose 'Text Message' or 'Phone Call' under 'How do you want to get codes?' then 'Try it'. Enter the code you received and click 'Next', then 'Turn On'. Prev Page 5 of 9 Next Prev Page 5 of 9 Next Should you lose access to your Android device, Google provides backup codes, which can each be entered once only to sign into your account. If you're using an Android device, switch to a computer with a printer for this step and navigate to Google sign-in options (opens in new tab). Scroll down to the section marked 'Set up an Alternative second step' and then on 'Set up' underneath the 'Back up Codes' section.Click 'Print' or write these codes down, then store them in a safe place. You'll be given ten one-use codes by default but you can come back here and click 'Get New Codes' if you wish. Prev Page 6 of 9 Next Prev Page 6 of 9 Next Re-entering codes sent via SMS each time you sign in from a new location can be tedious. For this reason you can enable 'Google Prompt'. On your Android Device go to the 'Sign in and Security' section and click 'On' besides '2-Factor Authentication'.Click 'Set Up' underneath 'Google Prompt' then 'Get Started' to complete the process. You may need to update Google Play services (opens in new tab) to get this working.If your handset isn't compatible, consider using an Authenticator app like 'Google Authenticator', which is available from the Google Play Store. Once installed click 'Set Up' under 'Authenticator App' to begin. Prev Page 7 of 9 Next Prev Page 7 of 9 Next App passwords allow people using 2-Step Verification to access their account through third party apps, such as people who send and receive Google e-mails through Microsoft Outlook.On your Android device or Computer head to the 'Sign in and Security' page and select the correct app and device from the dropdown menus on the screen.The page will then display a 16 character password. You do not have to remember this but make sure to copy and paste it into the password field on your application as it won't be displayed again. Prev Page 8 of 9 Next Prev Page 8 of 9 Next If you lose a device using an app-specific password, go to the App passwords (opens in new tab) page on your Android device or computer and click 'Revoke' under the name of the relevant app. If you're having trouble signing into your Google account, click on the link marked 'Try another Way to sign in' at any time. You'll see options to sign in using some of the secondary methods such as entering one of your backup codes.If you have none of these 'Ask Google for Help' and re-enter your phone number they'll get back to you in 4-5 business days. Prev Page 9 of 9 Next Prev Page 9 of 9 Next Image: Mackenzie Burke Apple Apple just wrapped up their Fall 2022 event, Far Out, which featured new announcements in the Apple line up including the iPhone 14, Apple Watch Ultra, AirPods Pro 2, and much more. For the full step-by-step article, head to: 01:38 Published: June 17, 2022 Modified: June 17, 2022 Read More See all videos Android is a flexible mobile operating system that's designed to work out of the box. Most users will never have to dig into its advanced options, but if you ever need to tweak the OS or you want to run an app that requires advanced permissions, you can activate the developer mode. When you enable the developer mode on Android, you gain access to all sorts of information, settings, and options that are usually hidden. These instructions apply to smartphones running Android 10, Android Pie (9), Android Oreo (8), and Android Nougat (7). Developer mode is designed primarily for Android developers. It reveals options and settings that developers need access to when testing new apps. Average users usually don't have any need to access these options, which is why the mode is turned off by default. Jeremy Laukkonen Even though developer mode is designed for developers, it isn't just for developers, and it has uses that extend far beyond app creation and testing. Enabling developer mode gives you access to a screen recorder, exposes settings to increase animation speeds and boost high-end game performance, and is a prerequisite for rooting your phone or installing a custom operating system. Even something as simple as spoofing your GPS location, or fooling apps into thinking you're somewhere that you aren't, requires you to enable developer mode. For example, if you want to spoof your GPS in Pokemon Go, you need to enable developer mode. If you install an app and it prompts you to enable developer mode, you have to choose between activating developer mode or not using the app. Before you proceed, make sure that you obtained the app from a trusted source, such as Google Play, and that the app isn't malware. Enabling developer mode on Android is a straightforward process. All you have to do is locate the menu where your phone's build number is displayed, and then tap the build number until developer mode activates. It's also an entirely reversible process, so you can always disable developer mode later if you change your mind. Here's how to turn on Android developer mode: Navigate to Settings > About phone. These instructions are for a phone running stock Android. Modified Android versions may have to navigate to Settings > About device, or Settings > About > Software information > More or similar instructions. Scroll down until you locate the Build number section. Select the Build number until you see a message that says You are now a developer! You likely will not receive any feedback after the first few taps. Keep tapping and you'll eventually see a message that says, "You are now x steps away from being a developer." Before you can complete the process, your phone may ask you for your PIN. When you see the message that says you are a developer, that means you have successfully turned on developer mode. If you were trying to install or use an app that requires developer mode, you can return to that app and should have access to all of the exclusive developer options. In some cases, activating developer mode isn't enough. For instance, if you're trying to spoof your GPS, you need to make additional changes in the developer options menu after you have enabled developer mode. Luckily, you can easily access the developer options menu from the system menu on your phone. If an app requires developer mode and it is a trusted app, then turning developer mode on is generally safe. However, activating and changing various developer options, without understanding what you're doing, can have unwanted effects. Only use the developer options menu if you know what you're doing, or if you're carefully following instructions provided by such an app. Navigate to Settings > Developer options. With the developer options menu open, you'll have access to information about your phone that you would not otherwise see. You will also have the ability to activate a variety of advanced options. You can safely leave developer mode on, even if you aren't using it for anything. If you decide that you would rather not have developer mode enabled, you can disable it from the developer options menu: Navigate to Settings > Developer options. Select the "On" toggle at the top of the Developer options screen. It should change to Off. Thanks for letting us know! Get the Latest Tech News Delivered Every Day Subscribe Tell us why!
